Milestone 3 – Prioritisation, Metrics & Growth

Description: A voice-input experience that lets users review, edit, and confirm AI-generated transcripts before sending, improving control, accuracy, and confidence.

Project : AI Voice Draft – Review, Enhance & Send
Product: ChatGPT Mobile (India)
Author: Bageesh Datt Mishra
Resources:Milestone 1 research, Milestone 2 user research, Mind Map, Solution Prioritisation, User Flow, Annotated Wireframes, AI-assisted Figma Prototype.

Problem Definition

What is the problem?
Many users avoid ChatGPT Voice Input because they don't trust the transcription accuracy and cannot confidently review or edit their voice prompt before sending.

Who is facing the problem?
Students and early-career professionals in India who frequently use ChatGPT on mobile for learning, coding, and productivity.

What is the business value that will be unlocked by solving the problem?
Improving trust in Voice Input can increase feature adoption, user engagement, and long-term retention on ChatGPT Mobile.

How will the target users benefit if the problem is solved?
Users can speak naturally, review or refine their transcript, and send prompts with greater confidence and accuracy.

Why is it urgent to solve this problem now?
As voice-first AI usage continues to grow, improving the Voice Input experience is essential to meet user expectations and drive adoption.

Goals

Business Goals

- Increase Voice Input adoption among ChatGPT Mobile users.
- Improve user engagement through more successful voice interactions.

Product Goals

- Increase user confidence in Voice Input by enabling transcript review before sending.
- Reduce voice prompt abandonment by improving user trust and control before submission.
- Improve repeat Voice Input usage by providing a more reliable experience.

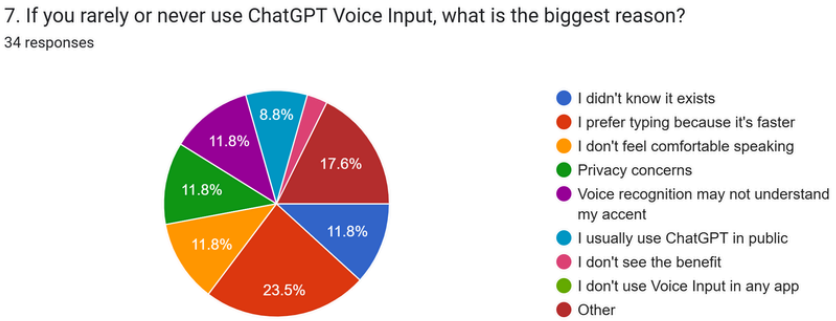

Non-Goals

- Redesigning the overall ChatGPT application or navigation.
- Improving the underlying speech-to-text model or AI transcription engine.
- Introducing real-time voice conversations or voice assistant capabilities.
- Supporting offline voice recognition in the MVP.

Validation of the Problem

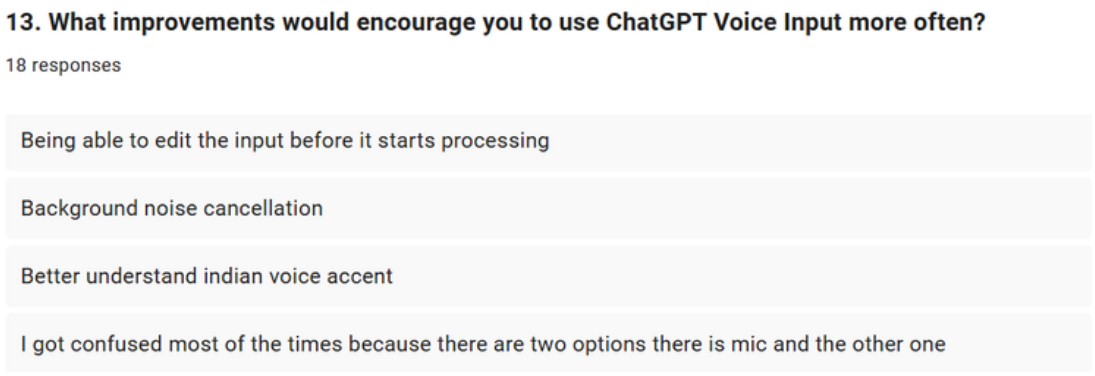

A. User Research Insights

To validate the problem, I conducted a survey with 38 ChatGPT users and interviewed 5 users. The research explored Voice Input usage, adoption barriers, and user expectations. The findings showed that users prefer typing because it offers greater confidence and control over their prompts.

Key Insights

- Users preferred typing over Voice Input due to higher confidence and control.
- Transcription accuracy and accent recognition were major barriers.
- Users wanted the ability to review and edit their transcript before sending.
- Mixed-language conversations and background noise reduced trust in Voice Input.

Interview Insights

- Multiple users requested the ability to review and edit their transcript before processing, indicating a need for greater control over Voice Input.

B. Competitive Landscape

Product	Key Learning
Google Assistant	Shows recognized speech before execution.
Gemini	Allows transcript review/editing before use.
ChatGPT	Limited transcript review before processing, creating an opportunity to improve user confidence.

Understanding the Target Audience

Target Segment

Primary Users

- Students (18–24 years)
- Job seekers
- Early-career professionals

Why this segment?

- Frequent ChatGPT mobile users
- High voice adoption potential
- Prefer typing due to trust and control issues

Representative Persona- Aman (22)

Occupation: Engineering Student

Uses ChatGPT for

- Learning
- Coding
- Interview preparation

Behaviour

- Uses ChatGPT daily
- Tries Voice Input occasionally
- Switches back to typing for important prompts

User Goals

- Complete tasks faster using Voice Input
- Reduce typing effort for long prompts
- Review prompts before sending
- Use Voice Input confidently
- Increase productivity while multitasking

Pain Points

- Doesn't trust transcription accuracy
- Cannot edit the transcript before sending
- Background noise affects recognition
- Mixed Hindi-English speech reduces accuracy
- Prefers typing for better control

Solution Overview

Based on insights from user research, three solution directions were explored to address different barriers to ChatGPT Voice Input adoption. Each solution targets a different user pain point identified during surveys, interviews, and competitive analysis. The solutions were evaluated based on **user impact, implementation effort, confidence, and business value,** before selecting the final direction.

Solution Direction 1 – Smart Voice Suggestions

Problem it solves -

Many users are aware of Voice Input but forget to use it or don't know when it would be beneficial.

Description

This solution introduces contextual nudges that recommend Voice Input when the system detects long typed queries or situations where speaking could be faster. Instead of waiting for users to discover the feature themselves, ChatGPT proactively encourages Voice Input at the right moment.

Pros

- Increases Voice Input awareness.
- Encourages first-time adoption.
- Low development effort.

Cons

- Doesn't solve users' trust or control issues.
- Users may still switch back to typing after trying Voice Input.

Solution Direction 2 – Adaptive Voice Mode

Problem it solves -

Some users avoid Voice Input because background noise, Indian accents, or mixed-language conversations reduce transcription accuracy.

Description

The system automatically adapts to environmental conditions by optimizing speech recognition based on background noise, speaking style, and regional accents, resulting in more reliable transcription quality.

Pros

- Improves transcription accuracy.
- Better experience in noisy environments.
- Supports diverse speaking patterns.

Cons

- Requires significant engineering effort.
- Depends on improvements to the speech recognition model.
- Longer implementation timeline.

Solution Direction 3 – AI Voice Draft (Selected)

Problem it solves -

Research showed that the biggest barrier is lack of trust and control. Users hesitate because they cannot review or edit the transcript before sending.

Description

Voice Input is converted into an editable transcript. An optional AI-enhanced version is also generated. Users can compare, edit, or re-record either version before explicitly confirming the final prompt. This combines the speed of Voice Input with the control of typing.

Pros

- Directly solves the biggest user pain point.
- Increases confidence in Voice Input.
- Reduces transcription-related errors.
- Improves repeat Voice Input usage.

Cons

- Adds one additional review step before sending.
- Slightly increases interaction time.

Solution Comparison

Criteria	Smart Voice Suggestions	Adaptive Voice Mode	AI Voice Draft
User Impact	Medium	High	⭐ High
Implementation Effort	Low	High	Medium
Confidence	Medium	Medium	⭐ High
Time to Launch	Fast	Slow	Moderate
Decision	Consider	Future	✅ Selected

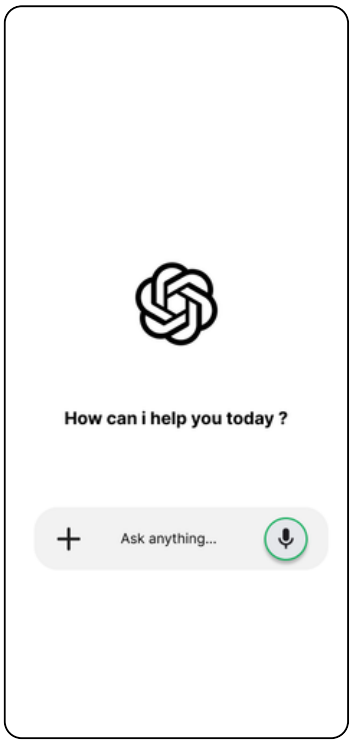

Why was AI Voice Draft selected?

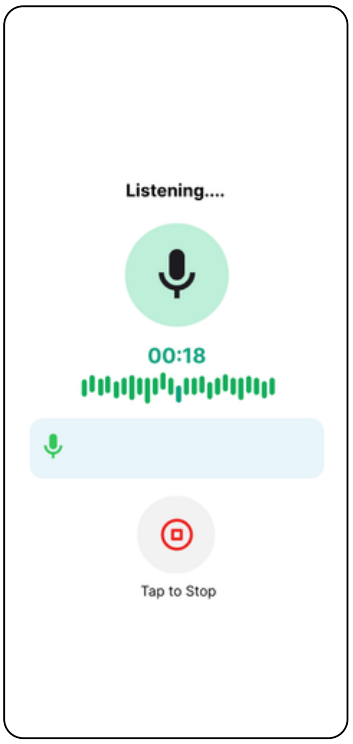

AI Voice Draft was selected because it directly addresses the biggest user pain point identified during research—lack of trust and control. Unlike Smart Voice Suggestions, it improves the core Voice Input experience rather than simply increasing awareness. Compared to Adaptive Voice Mode, it delivers high user impact with significantly lower implementation effort, making it the most practical solution for an MVP while providing clear business value through higher Voice Input adoption and engagement.

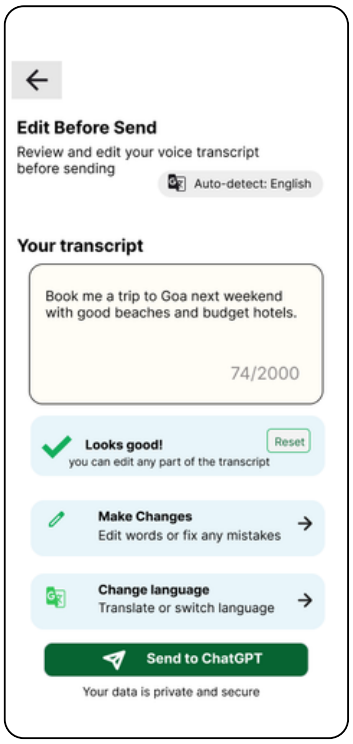

User Flow

Wireframes

[Prototype Link]

Key Features

The proposed solution introduces the following user-facing features to improve Voice Input adoption and build user confidence.

Feature	User Benefit
Editable Transcript	Users can review and edit the transcribed text before sending, reducing errors and increasing confidence.
AI-Enhanced Draft	AI refines the transcript into a clearer and more structured prompt while preserving the user's intent.
Draft Comparison	Users can compare the original transcript with the AI-enhanced version and choose the preferred one.
Review & Confirm	A confirmation step ensures users have full control before the prompt is sent to ChatGPT.
Re-edit / Switch Draft	Users can modify the selected draft or switch between the original and AI-enhanced versions at any time before sending.
Continue Conversation	After receiving the response, users can seamlessly continue interacting using voice or text.

Key Logic & Project Alignment

1. AI Voice Draft Pipeline

1. Convert speech into text using the existing speech recognition engine.
2. Generate an AI-enhanced draft while preserving the user's original intent.
3. Store both the Original Transcript and AI-Enhanced Draft in a temporary draft state.
4. Allow users to compare, edit, or switch between both versions.
5. Submit only the user-confirmed draft to ChatGPT.

2. Data Captured

- Voice session started
- Transcript generated
- AI draft generated
- Draft selected (Original / AI Draft)
- Draft edited before sending
- Confirm & Send completed
- Voice prompt abandoned

3. Future Improvements

- **Personalized AI Drafts:** Adapt writing style based on previous user interactions.
- **Multilingual Optimization:** Improve AI drafting quality for regional languages.
- **Learning from Edits:** Use anonymous edit patterns to continuously improve AI-generated drafts.
- **Smart Draft Suggestions:** Suggest concise, detailed, or creative prompt styles based on user intent.

Launch Readiness

1. Key Milestones

Milestone	Status
User Research & Validation	✅ Complete
Solution Finalization	✅ Complete
User Flow & Wireframes	🟡 In Progress
Design Sign-off	Planned
Development	Planned
QA & Testing	Planned
Internal Dogfooding	Planned
A/B Experiment	Planned
Public Rollout	Planned

2. Launch Checklist

Stakeholder---Responsibility

- **Product :** Finalize PRD, rollout plan and launch criteria
- **Design :** Complete UI screens and interaction flow
- **Engineering :** Implement AI Voice Draft workflow
- **AI/ML :** Validate AI-generated draft quality
- **QA :** Test voice flow across supported devices
- **Data Team :** Configure analytics events and dashboards
- **Support :** Prepare FAQs and user support documentation

3. Experimentation Plan

Item---Details

- **Experiment Type:** A/B Test
- **Control Group :** Existing Voice Input experience
- **Variant Group :** AI Voice Draft – Review, Enhance & Send
- **Target Users :** 10% of mobile users
- **Duration :** 2 weeks
- **Decision Criteria :** If user adoption and completion improve without increasing abandonment, proceed with wider rollout.

Open Questions & Decisions Taken

During the solution exploration and review process, several product decisions were evaluated to ensure the proposed feature balances usability, trust, and implementation effort.

Open Question

- Should the AI-enhanced draft replace the original transcript?
- Should the prompt be sent automatically after voice input?
- Should AI enhancement be mandatory?
- What should happen if AI enhancement fails?

Decision Taken

After evaluating user research findings and the project goals, the following decisions were made:

- The original transcript and AI-enhanced draft will both be shown, allowing users to choose the version they prefer.
- A Review & Confirm step will be added before sending the prompt to ChatGPT.
- AI enhancement will remain optional, giving users full control over the final prompt.
- If AI enhancement is unavailable, the original transcript will still be available for editing and submission.

Scope Excluded

To keep the MVP focused on validating the core hypothesis, the following features have been intentionally excluded:

- Personalized AI writing styles.
- Support for all regional languages.
- Voice history and saved drafts.
- Offline voice processing.
- Cross-device draft synchronization.
- Advanced prompt templates.

These features are valuable but are not essential for validating whether reviewing and enhancing voice prompts increases adoption.

Trade-offs

The proposed solution introduces an additional review step before sending the prompt, which slightly increases the interaction time. However, this trade-off improves user confidence and reduces accidental or incorrect submissions.

Generating both the original transcript and an AI-enhanced draft also requires additional processing, but it provides users with greater transparency and control over the final prompt.

To reduce implementation complexity, the MVP is limited to the mobile Voice Input experience and English language support. Multilingual support and personalization can be explored in future iterations after validating the core solution.
